Materials are used in AutoCAD Cracked Version to define various types of surface finishes, textures, colors, and transparency. By default, materials are created when a new drawing is opened, or when a drawing is closed or saved. In a Windows application, a drawing is considered to be closed if its handle no longer points to a file that contains a drawing. For example, the file might be open in the background or in another program. When the drawing is closed, the drawing material is destroyed. A material is composed of one or more layers. Layers specify how the material's effects are to be displayed. Materials can be combined, which allows creating layers with different shading and transparency characteristics. Different layers can be arranged in a hierarchy. There are two kinds of layers: A layer is visible or non-visible. A visible layer can be edited using Layer Edit tools. A non-visible layer cannot be edited. A visible layer can be selected, and changed using Layer Effects tools. A non-visible layer cannot be selected. A layer can be assigned to a layer mask. The layer mask controls which layers are used to generate the appearance of a part of the drawing. Materials that contain layers can also be combined with one another. The combination of materials allows creating complex effects. In general, materials are not normally combined. Some parts of the drawing, such as the drawing surface, are not affected by materials. As with all tools in AutoCAD Crack For Windows, materials can be exported and imported. A material can be exported and imported into another drawing, or into the same drawing. A mask material can be used to hide parts of a drawing. A mask material is a special type of layer. An effect material is used to control how light and colors interact with a layer. There are a number of kinds of effect materials. Different kinds of effect materials control the appearance of parts of a drawing. An effect material can be exported and imported. A template material, which is used to create drawing templates. A template material is similar to a document. A drawing in a template is called a sheet.
