This tutorial explains how to draw lines with different widths in AutoCAD. The video tutorial will teach you how to draw lines with different widths. The basic concepts like working with the command line interface (CLI) in AutoCAD will be shown in this tutorial. In AutoCAD, the width of a line is determined by the Endpoint. The Endpoint is the point that ends the line and also determines the location where the next line starts. AutoCAD is very flexible in creating and maintaining complex design workflows. With advanced features such as Block Manager and the extensive Connections panel, you can make connections between lines and blocks, quickly and easily. You will learn how to create 3D extrusions by following the video tutorial. What are the features of AutoCAD? This video tutorial explains various features of AutoCAD. The features explained in this video tutorial are listed below: Add and modify text The Ability to edit text and type. Create 3D objects The ability to create new 3D shapes and manipulate existing 3D shapes. Join and split blocks The ability to create blocks and change the topological arrangement of blocks. Draw, modify, and transform lines The ability to create, modify, and transform lines and arcs. Detect and repair objects The ability to detect and repair objects in your drawings. Hairlines The ability to create simple or more detailed edge features on objects Trim edges The ability to trim the edges of objects. Weld lines The ability to weld together different lines. Create bezier arcs The ability to create bezier curves and draw them in AutoCAD. Create spline curves The ability to create spline curves and draw them in AutoCAD. Extend lines The ability to extend line segments. Create blocks The ability to create blocks. AutoCAD tip: Line Width The easiest way to modify line width is to use the line selector to select the line you want to modify and the Line Style menu. Drawing and Editing Lines in AutoCAD The following image shows a drawing page in AutoCAD. The drawing page contains the drawing viewport and the drawing area. A UIView can respond to touch events using the following: - (void)touchesBegan:(NSSet *)touches withEvent:(UIEvent *)event How would I create a class that responds to any of these if I want to for example check if a class responds to a particular selector? A: This is a pretty standard thing to do, and is accomplished via the respondsSEL: and canSEL: methods of NSObject. For example, the following will fail: if ([thing respondsSEL:@selector(touchesBegan:withEvent:)]) { // it does } else { // it doesn't } And the following will succeed: if ([thing respondsSEL:@selector(touchesBegan:withEvent:)]) { // it does } else { // it doesn't } There is a UIView subclass that already has this functionality built in: [[self class] respondsToSelector
